

Toronto Forklift Training Course

Toronto Forklift Training Course - Industry and federal regulators have established the criteria for forklift safety training according to their current standards and regulations. People wanting to utilize a forklift must complete a forklift training course prior to making use of one of these equipment. The accredited Forklift Operator Training Program is designed to offer people training with the knowledge and practical skills to become an operator of a forklift.

There are forklift operation safety rules that should be followed pertaining to pre-shift inspections, and rules for loading and lifting.

An inspection checklist must be carried out and submitted to the supervising authority before beginning a shift. When a maintenance issue is uncovered, the use of the particular machine must be stopped until the problem has been dealt with. To be able to indicate the equipment is out of order, the keys should be removed from the ignition and a warning tag placed in a visible location.

Safety regulations for loading would include checking the forklift's load rating capacity to know how much the machinery could handle. When starting the machine, the forks must be in the downward position. Bear in mind that there is a loss of approximately one hundred pounds carrying capacity for every inch further away from the carriage which the load is carried.

Lifting must begin with the driver moving to a stopped position about three inches away from the load. The mast must then be leveled until it has reached a right angle with the load. Lift the forks to an inch below the slot on the pallet and drive forward. Then lift forks four inches. Tilt back the load to secure it for moving. Drive the lift backwards if the load obscures frontal vision. Check behind and honk to alert other personnel. Do not allow forks to drag on the ground.

The load should be loaded by the forklift in such a way that ensures the load is secure and will not create a hazard to other objects or people. Restraining loads is required for materials that can shift during transport and destabilize the forklift.

Drums can be strapped together to be able to prevent shifting and movement of the drums. Forklift operators must drive slowly when moving liquids, to reduce instability in the forklift.
